LAB 2.1 Create URLs with PHP

Assume that link to your website is: **http://domain.com**
Or locally **http://localhost/**

Assign links to buttons in Navigation bar (Horizontal Menu)

From previous layout, organize your buttons in horizontal navigation, such as:

| Home | Products | Login | Register |

Assign links to above buttons as:
  http://localhost/index.php?page=home (URL 1)

  (default file: `index.php`)

  Similarly,
  http://localhost/index.php?page=products (URL 2)
  http://localhost/index.php?page=login (URL 3)
  http://localhost/index.php?page=register (URL 4)

  Make sure when you click on the links, some contents appear inside **body section** of the web page interface.

  When you click on URL 1, the browser loads home.php
  Similar with URL 2 and URL 3, browser loads products.php and login.php

  Note: You can include different files *.php inside the main interface, by using
  include "filename.php";

  Expected outcome: you complete the files:
  - index.php
  - home.php
  - login.php
  - css + js files (*if needed*)
