LAB 3.2 Exercises with AJAX

3.2.1 Write programming code in Javascript (**AJAX**) to access a text file stored on the server and display the file content on the screen.

3.2.2 Write programming code in Javascript (**AJAX**) to access the database server, retrieve data from the "products" table from previous lab. The data was retrieved in the form of XML format. Show the data on the screen.

3.2.3 Apply **AJAX** to the search form (from previous lab) to search for a specific product. When the user input the first letter in the search box, it *drops down a list of products* with the product name starting with the letter. The user can then *select one of the product name* in the list, click the link to see the product details.
