LAB 2.3 Login, logout, cookies, sessions

Click on the link:
`http://localhost/index.php?page=login`
you will see the login form with the input:
- o Username: E-mail address
- o Password: ************
- o Login button

- After click the "Login" button, the values (E-mail address and password) will be sent to server for processing (login_processing.php).
- Receive these values, compare them with the pre-stored values in "users" table to authenticate the user. If they match, let the user in, otherwise send notification "Incorrect username or password!"
- Send cookie(s) to user machine.
- Assign neccessary value(s) to global variables $_SESSION
- If the user logged in, replace button "Login" by "Logout", assign the link to "Logout" and create the file "logout.php". Remove the button "register" too, if it exists.
- After the user logged in, redirect the user to the web page you want (dashboard for that user).
- The users could be in different groups (user levels), with different permissions. Insert the user level to all users and recognize them after logging in.
- Show the user "name" and "user level" in all web pages.

==Expected outcome: you complete the files:==
- login.php
- login_processing.php
- logout.php
